

EE4620 - Spectral Domain Methods in Electromagnetics

Topic # 5

Introduction to Leaky Wave Antennas

Nuria Llobart

Antennas Printed in Stratified Dielectrics

Dielectric allows using integrated technology (PCB, lithography)

E.g. of a linear array

Main problem:
surface waves

There is a part of the power delivered to the antenna that is radiated inside the dielectric!

Dyadic Green's Function for Stratified Media

$$\mathbf{f}(\vec{r}) = \frac{1}{4\pi^2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \tilde{\mathbf{G}}^{fc}(k_x, k_y, z, z') \mathbf{C}_s(k_x, k_y) e^{-jk_x x} e^{-jk_y y} dk_x dk_y$$

$$\tilde{\mathbf{G}}^{ej} = \begin{bmatrix} -\frac{v_{TM}k_x^2 + v_{TE}k_y^2}{k_\rho^2} & \frac{(v_{TE} - v_{TM})k_x k_y}{k_\rho^2} \\ \frac{(v_{TE} - v_{TM})k_x k_y}{k_\rho^2} & -\frac{v_{TE}k_x^2 + v_{TM}k_y^2}{k_\rho^2} \\ \varsigma \frac{k_x}{k} i_{TM} & \varsigma \frac{k_y}{k} i_{TM} \end{bmatrix}$$

$$\tilde{\mathbf{G}}^{hj} = \begin{bmatrix} \frac{(i_{TM} - i_{TE})k_x k_y}{k_\rho^2} & \frac{i_{TE}k_x^2 + i_{TM}k_y^2}{k_\rho^2} \\ \frac{i_{TE}k_y^2 + i_{TM}k_x^2}{k_\rho^2} & \frac{(i_{TE} - i_{TM})k_x k_y}{k_\rho^2} \\ \frac{k_y}{\varsigma k} v_{TE} & \frac{k_x}{\varsigma k} v_{TE} \end{bmatrix}$$

$$k_{zi} = \sqrt{k_i^2 - k_x^2 - k_y^2}$$

$$Z_{TMi} = \zeta_i k_{zi} / k_i \quad Z_{TEi} = \zeta_i k_i / k_{zi}$$

$$\tilde{\mathbf{G}}^{hm} = \begin{bmatrix} -\frac{i_{TE}k_x^2 + i_{TM}k_y^2}{k_\rho^2} & \frac{(i_{TM} - i_{TE})k_x k_y}{k_\rho^2} \\ \frac{(i_{TM} - i_{TE})k_x k_y}{k_\rho^2} & -\frac{i_{TM}k_x^2 + i_{TE}k_y^2}{k_\rho^2} \\ \frac{k_x}{\varsigma k} v_{TE} & \frac{k_y}{\varsigma k} v_{TE} \end{bmatrix}$$

$$\tilde{\mathbf{G}}^{em} = \begin{bmatrix} \frac{(v_{TM} - v_{TE})k_x k_y}{k_\rho^2} & -\frac{v_{TE}k_y^2 + v_{TM}k_x^2}{k_\rho^2} \\ \frac{v_{TE}k_x^2 + v_{TM}k_y^2}{k_\rho^2} & \frac{(v_{TE} - v_{TM})k_x k_y}{k_\rho^2} \\ -\varsigma \frac{k_y}{k} i_{TM} & \varsigma \frac{k_x}{k} i_{TM} \end{bmatrix}$$

Preferred Branch Convention

Selection of square root multivalues on the Riemann sheets to obtain a **unique specification of the integrand in the complex plane**

$$k_z = -j \sqrt{-(k^2 - k_\rho^2)}$$

Top Riemann Sheet:

$$\text{Imag}(k_z) < 0$$

$$\text{Real}(k_z) > 0$$

$$\text{Real}(k_z) < 0$$

The radiation condition is verified

Branch cuts

Pole Singularities in Stratified Media

Pole singularities in k_ρ arise in dielectric stratifications

$$k_{zi} = \pm \sqrt{k_i^2 - k_\rho^2}$$

The solutions of the transmission lines can be expressed as:

$$v_{TM/TEi}(k_\rho, z) = \frac{N_{TM/TEi}^v(k_\rho, z)}{D_{TM/TE}(k_\rho)}$$

$$i_{TM/TEi}(k_\rho, z) = \frac{N_{TM/TEi}^i(k_\rho, z)}{D_{TM/TE}(k_\rho)}$$

Q: Which ones are the transversal propagation constants?
> k_ρ probably

- Dispersion equation to find transversal propagation constants:

$$D_{TM/TE}(k_\rho) = 0$$

$$k_{\rho 0} = k_\rho^g - \frac{D(k_\rho^g)}{D'(k_\rho^g)}$$

- Residues to find the surface wave field distribution and associated power

$$v_{TM}(k_\rho, z) = \frac{N(k_\rho)}{D(k_\rho)}$$

$$\text{Res}[v_{TM}(k_\rho, z)]|_{k_{\rho i}} = \frac{N(k_{\rho i})}{D'(k_{\rho i})}$$

Examples of Surface wave poles

Surface Waves

Polar singularity in the real axis
with $k_\rho > k_0$

SW Field Contribution

$$\vec{f}(\vec{r}) \approx \frac{1}{4\pi^2} \int_0^\pi \int_{-\infty}^\infty \tilde{\mathbf{G}}^{fc}(k_\rho, z, z') k_\rho e^{-jk_\rho \rho} k_\rho dk_\rho d\alpha \vec{\mathbf{C}}_0(k_{\rho c}, \phi)$$

Surface wave poles are found on the real axis in the Top Riemann Sheet

$$\vec{f}_{sw}(\vec{r}) = -2\pi j \sum_i \text{Res} \left[\frac{e^{\frac{j\pi}{4}} \sqrt{k_\rho} e^{-jk_\rho \rho}}{2\pi \sqrt{2\pi \rho}} \tilde{\mathbf{G}}^{fc}(k_\rho, z, z') \vec{\mathbf{C}}_0(k_\rho, \phi) \right] \Bigg|_{k_\rho = k_{\rho i}}$$

Field contributions in the form of cylindrical propagating waves inside the stratified dielectrics

Surface Waves

$$k_{\rho}^{sw} = \beta^{sw} = k_0 \sqrt{\epsilon_r^{sw}}$$

$$k_0 < k_{\rho}^{sw} < k_d$$

They are also referred as
slow waves

$$k_{\rho}^{sw} = \frac{2\pi f}{v_{sw}} > k_0 \quad v_{sw} < v_0$$

It can be seen as a couple of **homogenous waves propagating inside the dielectric** with a direction characterized by a real angle $\pm\theta_{sw}$:

$$\beta^{sw} = k_d \sin\theta_{sw} < k_d \quad \sin\theta_{sw} = \frac{\sqrt{\epsilon_r^{sw}}}{\sqrt{\epsilon_r}}$$

There is no attenuation, therefore the energy carried by the surface wave will reach *infinity*

It is an **inhomogenous wave** in the air region:

$$k_{z0sw} = -j\sqrt{-\left(k_0^2 - (k_{\rho}^{sw})^2\right)} = -j\alpha_{zsw}$$

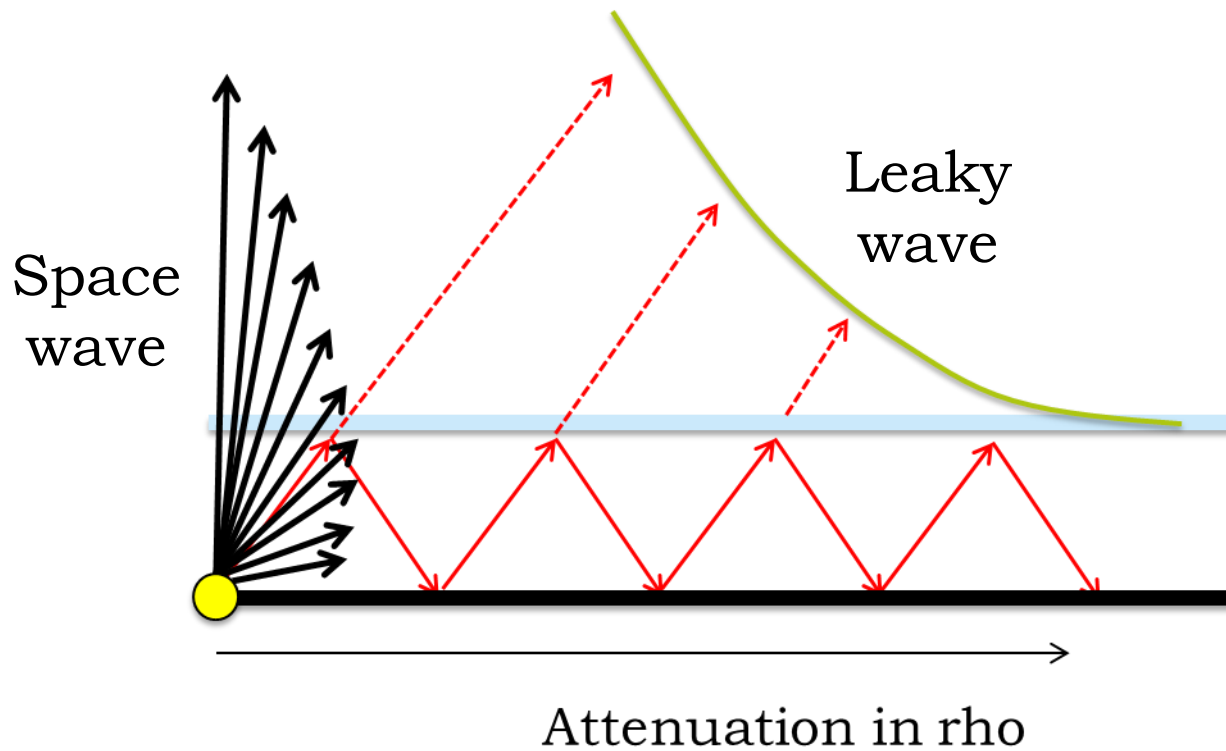

The sw angle is above the critical angle

$$\sqrt{\epsilon_r} \sin\theta_{sw} = \sin\theta_0$$

$$\sqrt{\epsilon_{rsw}} = \sin\theta_0$$

Therefore θ_0 is imaginary

Introduction to leaky waves in stratified media

Leaky Wave Poles

The spectrum seems to peak at a certain location in the visible spectrum, but does not go to infinity

Polar singularity in the complex plane
close to the real axis with $\text{Re}[k_\rho] < k_0$

Pole Singularity of Leaky Waves

Complex pole singularities:

$$k_{\rho lw} = \beta_{lw} - j\alpha_{lw}$$

They are present only in certain stratifications

$$0 < \beta_{lw} < k_0$$

$$Im(k_{\rho lw}) < 0$$

They radiate energy into the infinite medium

They are found in the bottom sheet

Bottom Riemann Sheet

$$\text{Imag}(k_z) > 0$$

$$\text{Real}(k_z) < 0$$

$$\text{Real}(k_z) > 0$$

$$k_z = +j\sqrt{-(k^2 - k_\rho^2)}$$

This is opposite to the standard choice

They are present close to the source

They enlarge the effective area of the source

The leaky wave pole is only captured for observation points near the source

The residue contribution does not arrive to infinity

But it is responsible to the power transferred to the far field of the antenna: **modulation of the SFG in the region around θ_{lw}^0**

They can be used to do pattern shaping!

They are cylindrical waves with the same ϕ -pattern and polarization than those of surface waves

Cylindrical LWs

TE Wave

Electric field oriented in the azimuthal direction

Maximum in the Hplane of the antenna

$$E_\phi(\rho, z) \approx -\text{Res}[v_{TE}(k_\rho, z, z')] \Big|_{k_{\rho i}} j_x(k_{\rho i}, \phi) \frac{C \sin \phi e^{-jk_{\rho i} \rho}}{\sqrt{\rho}}$$

TE Wave

TM Wave

Electric field oriented in the radial and z direction
Maximum in the Eplane of the antenna

$$E_\rho(\rho, z) \approx \text{Res}[v_{TM}(k_\rho, z, z')] \Big|_{k_{\rho i}} j_x(k_{\rho i}, \phi) \frac{C \cos \phi e^{-jk_{\rho i} \rho}}{\sqrt{\rho}}$$

$$E_z(\rho, z) \approx -\frac{\zeta k_{\rho i}}{k} \text{Res}[i_{TM}(k_\rho, z, z')] \Big|_{k_{\rho i}} j_x(k_{\rho i}, \phi) \frac{C \cos \phi e^{-jk_{\rho i} \rho}}{\sqrt{\rho}}$$

TM Wave

Main Purpose of discussing them is LW Antennas

They can be used to enhance the directivity at broadside of small antennas

Parallel Plate in Air

$$D(k_\rho) = jZ_0 \tan(k_{z0}h) = 0$$

TM Wave

TE Wave

for TM $k_{zs} \tan(k_{zs}h) = 0$

$k_{zs} = 0$ $\tan(k_{zs}h) = 0$

$k_{\rho 0} = k$ $k_{zs}h = n\pi$

$$k_{\rho n} = \sqrt{k^2 - \left(\frac{n\pi}{h}\right)^2}$$

for TE $\tan(k_{zs}h) = 0$

$k_{zs}h = n\pi$

$$k_{\rho n} = \sqrt{k^2 - \left(\frac{n\pi}{h}\right)^2}$$

Parallel Plate in Air

$$E = f(\phi, z) \frac{e^{-jk_\rho \rho}}{\sqrt{\rho}}$$

k_ρ -Spectrum

A PPW has no branch singularity, only real poles. These ones are SWs with propagation constant that can be $\leq k_0$

Open Parallel Plate Waveguide

Open Parallel Plate Waveguide

$$i(z = z_s) = Y_{in} = Y_0 \frac{Z_0 + jZ_l \tan(k_{z0}h)}{Z_l + jZ_0 \tan(k_{z0}h)}$$

$$D(k_\rho) = jZ_0 \tan(k_{z0}h) = 0$$

$$Z_l \neq 0$$

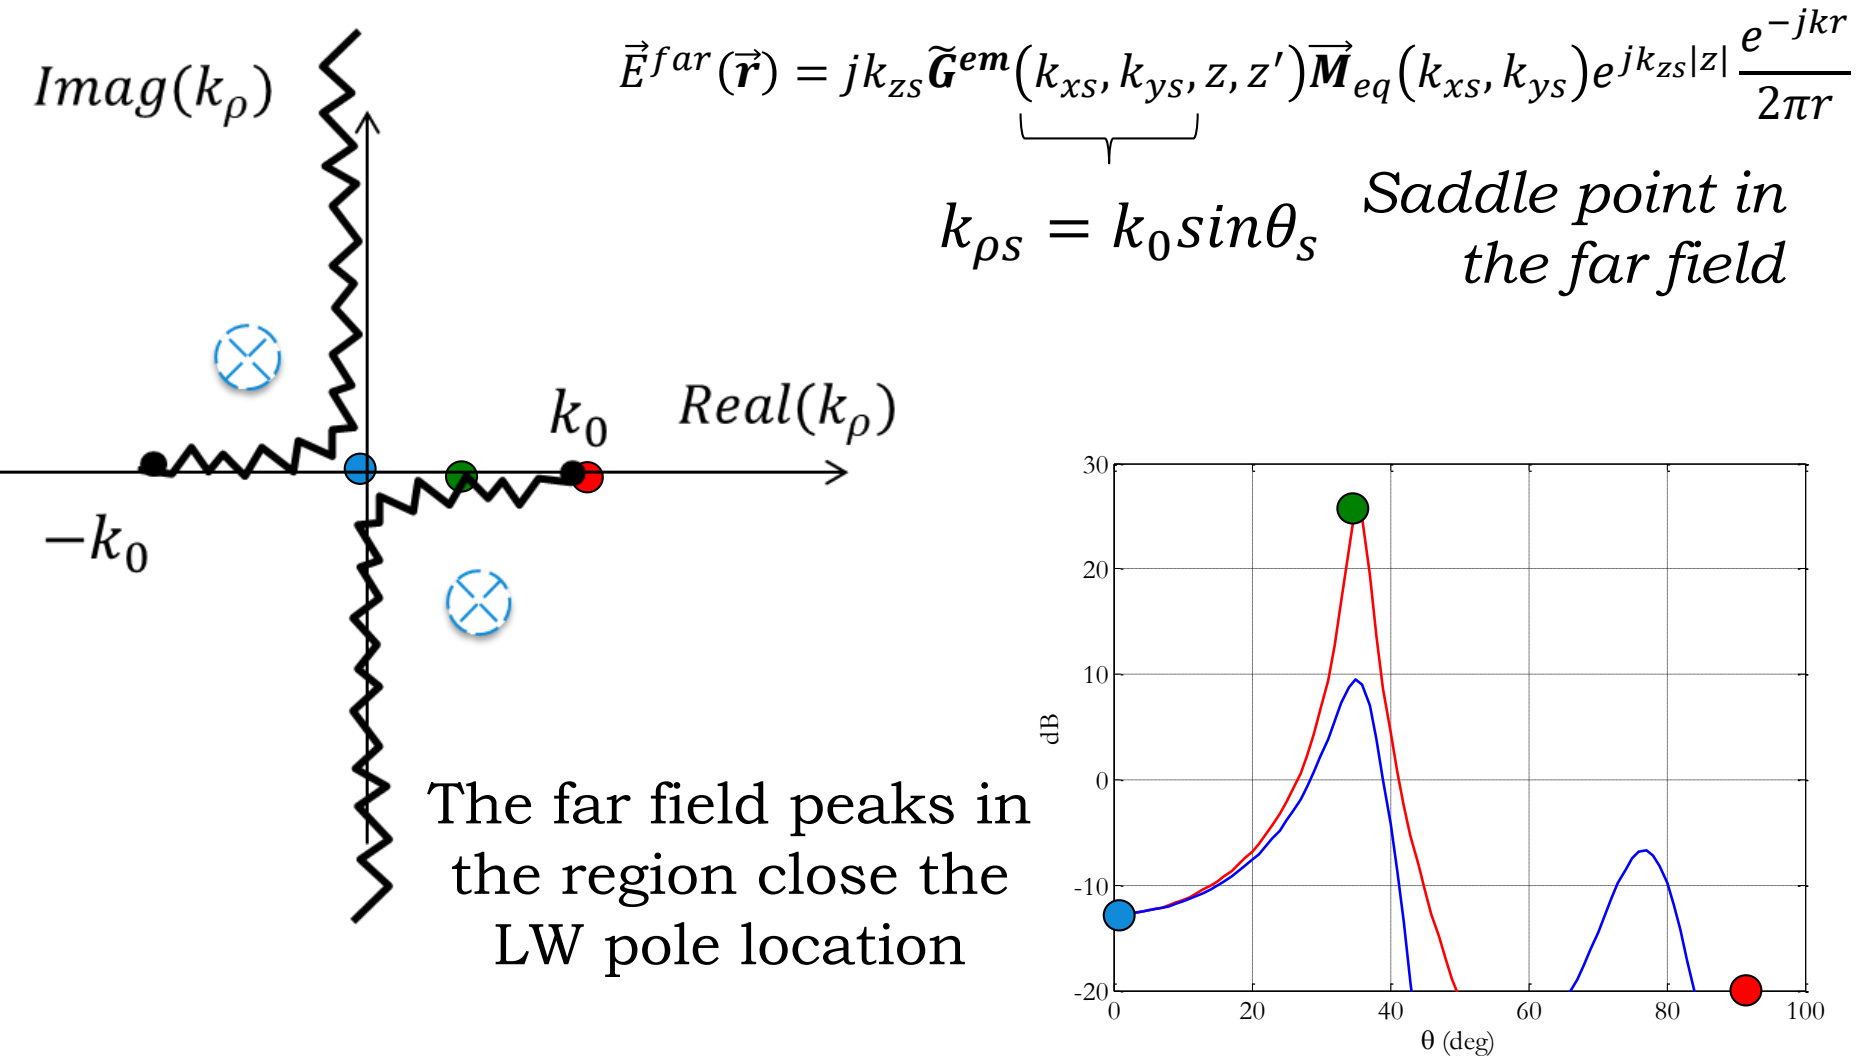

$$D(k_\rho) = Z_l + jZ_0 \tan(k_{z0}h) = 0$$

Open Parallel Plate Waveguide

Pattern shaping with leaky waves

Dispersion Equation: Analytical Approximated Solution

$$D(k_\rho) = Z_l + jZ_0 \tan(k_{z0}h)$$

Approximation 1:

The tan function can be approximated linearly around its zeroes for arguments in the surrounding of $x = \pm n\pi$, resorting to

$$\rightarrow \tan(k_{z0}h)|_{x \pm n\pi \approx 0} \approx k_{z0}h - n\pi$$

$n=1$

$$k_{z0} = j \frac{Z_l}{hZ_0} + \frac{\pi}{h} = \sqrt{k_0^2 - k_\rho^2}$$

A. Neto and N. Llombart, "Wideband Localization of the Dominant Leaky Wave Poles in Dielectric Covered Antennas," in IEEE Antennas and Wireless Propagation Letters, vol. 5, pp. 549-551, 2006, doi: 10.1109/LAWP.2006.889558.

Impact of the cavity top impedance

$$k_{z0} = j \frac{Z_l}{hZ_0} + \frac{\pi}{h} = \sqrt{k_0^2 - k_\rho^2}$$

The propagation constant highly depends on Z_l

$$k_\rho = \sqrt{k_0^2 - k_{z0}^2} = \beta - j\alpha$$

$$\beta = k_0 \sin \theta_{LW}$$

$$Z_l \downarrow \theta_{LW} \downarrow$$

Resonant condition:

$$h \approx \lambda_0/2$$

Tunning the cavity top impedance

For a quarter wavelength thick substrate (Z_l tends to zero for large ϵ_r):

$$h_d = \lambda_d/4$$

$$k_\rho = 0$$

$$Z_l = \zeta_0/\epsilon_r$$

Dispersion Equation: Analytical Solution

$$D(k_\rho) = Z_l + jZ_0 \tan(k_{z0}h)$$

$$k_{z0} = j \frac{Z_l}{hZ_0} + \frac{\pi}{h} = \sqrt{k_0^2 - k_\rho^2}$$

Approximation 2:

$$Z_l = Z_d \frac{Z_0 + jZ_d \tan(k_{zd}h_d)}{Z_d + jZ_0 \tan(k_{zd}h_d)} \quad \longrightarrow \quad Z_l \approx \zeta_0 / \epsilon_r$$

For poles radiating
close to broadside

Analytical Approximated Solution

$$k_{z0} = j \frac{\zeta_0}{h Z_0 \epsilon_r} + \frac{\pi}{h} = \sqrt{k_0^2 - k_\rho^2}$$

$$Z_{TE} = \zeta_i k_i / k_{zi}$$

$$Z_{TM} = \zeta_i k_{zi} / k_i$$

$$k_{z0}^{TE} = k_0 \left(\frac{1}{2\bar{h}} + j \frac{1}{4\bar{h}^2 \pi \epsilon_r} \right)$$

$$\bar{h} = h / \lambda_0$$

$$k_{z0}^{TM} = k_0 \left(\frac{1}{2\bar{h}} + j \frac{1}{\pi \epsilon_r} \right)$$

$$\epsilon_r \uparrow \quad \theta_{lw} \downarrow \quad \alpha_{lw} \downarrow$$

Leaky Waves

$$k_{\rho}^{lw} = \beta^{lw} - j\alpha^{lw}$$

$$\beta^{lw} < k_0$$

They are also referred as
fast waves

$$k_{\rho}^{lw} = \frac{2\pi f}{v_{lw}} < k_0 \quad v_{lw} > v_0$$

It can be seen as a couple of waves propagating with a direction characterized by a real angle $\pm\theta_{lw}$ and an attenuation:

$$\beta^{lw} = k_0 \sin\theta_{lw} < k_0$$

There is attenuation, therefore the leaky wave loses energy while propagates

There is also propagation in the air region that can be related to a real angle:

$$\sqrt{\epsilon_r} \sin\theta_{lw} = \sin\theta_{lw}^0$$

They do not verify the radiation condition in the infinite air medium

$$k_{z0}^{lw} = j\sqrt{-(k_0^2 - k_{\rho}^{lw})} = \beta_{zlw} + j\alpha_{zlw}$$

The difficulty with leaky Waves

$$\vec{f}_{LW}(\vec{r}) = -2\pi j \sum_i \text{Res} \left[\frac{e^{\frac{j\pi}{4}} \sqrt{k_{\rho LW}} e^{-jk_{\rho LW} \rho}}{2\pi \sqrt{2\pi \rho}} e^{-jk_{zLW} z} \tilde{\mathbf{G}}^{fc}(k_{\rho LW}, z=0, z') \vec{\mathbf{C}}_0(k_{\rho LW}, \phi) \right] \Bigg|_{k_{\rho}=k_{\rho LW}}$$

$$e^{-jk_{zLW} z} = e^{-j\beta_{zLW} z} e^{-j(j\alpha_{zLW})z}$$

$$= e^{-j\beta_{zLW} z} e^{\alpha_{zLW} z}$$

This scared people for decades
Their claimed was they did not exist

Integration path: far observation point

Complex pole singularities (Bottom sheet poles)

$$k_{\rho lw} = \beta_{lw} - j\alpha_{lw} \quad k_{zlw} = j\sqrt{-(k_0^2 - k_{\rho lw}^2)}$$

Waves that propagate in
the transverse direction
with attenuation

However it is captured
in other deformations:
near-field!!!

Not captured in the
deformation around
the branch

Near field observation points

For near field **steepest descent path** are the integration paths that guarantee most rapid convergence of the integral

Observation point

Saddle point exist in these paths

$$k_{\rho 1} = k_0 \sin 0 = 0$$

$$k_{\rho 2} = k_0 \sin \frac{\pi}{4} = k_0 / \sqrt{2}$$

$$k_{\rho 3} = k_0 \sin \frac{\pi}{2} = k_0$$

When is the LW pole captured?

Deformation on SDP

From the original path to SDP via deformation

The pole remains outside the enclosed region

In this case no pole is captured

$$\int_R f(k_\rho) dk_\rho = \int_{SDP} \tilde{G}^{fc}(k_\rho, z, z') e^{-j\vec{k}_\rho \cdot \vec{p}} k_\rho dk_\rho$$

Near field shaping with leaky waves

In this case a pole is capture in the bottom Riemann sheet

$$\int_R f(k_\rho) dk_\rho = \int_{SDP} \tilde{\mathcal{G}}^{fc}(k_\rho, z, z') e^{-j\vec{k}_\rho \cdot \vec{\rho}} k_\rho dk_\rho - 2\pi j \text{Res}[\tilde{\mathcal{G}}^{fc}(k_\rho, z, z') e^{-j\vec{k}_\rho \cdot \vec{\rho}} k_\rho] \Big|_{k_\rho = k_{\rho i}}$$

Existence Region

If you take any ρ , and then increase z from zero, the wave becomes larger... until it disappears at the shadow boundary

If you take $z = 0$, and then increase ρ from zero, the wave attenuates exponentially to zero

The leaky wave field contribution is in fact limited to a region of existence.

Existence Region

The leaky wave pole is only captured for observation points near the source

The residue contribution does not arrive to infinity

But it is responsible to the power transferred to the far field of the antenna: **modulation of the SFG in the region around θ_{lw}^0**

They can be used to do pattern shaping!

Enhanced Directivity

A_{source}

$$A_{eff} \propto \frac{1}{\alpha^2} \gg A_{source}$$

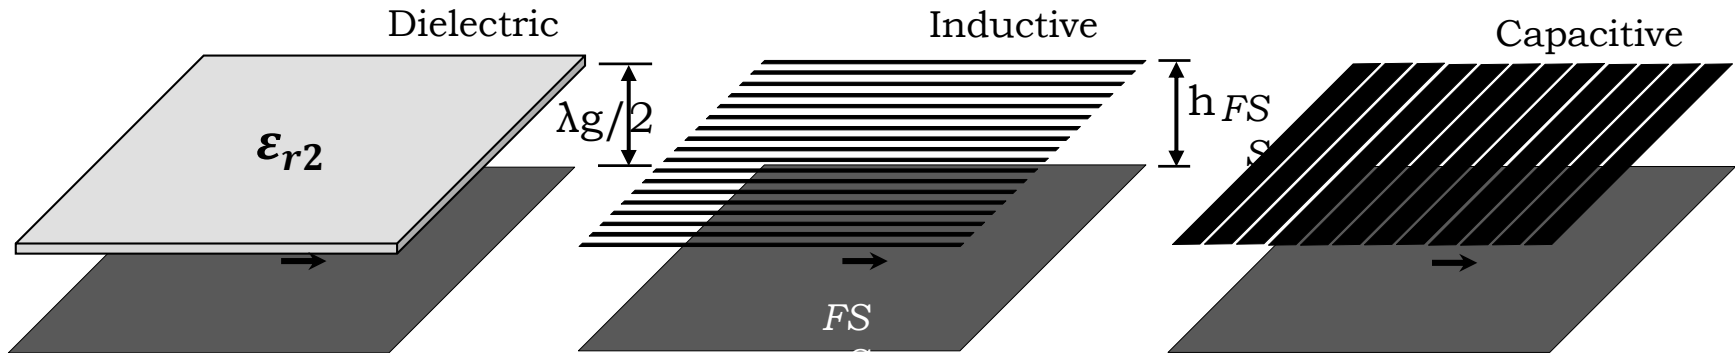

Resonant condition:

$$h = \frac{\lambda_0}{2 \cos \theta_0}$$

$$h_d = \frac{\lambda_{d2}}{4 \cos \theta_d}$$

Partially Reflecting Surfaces

Partially Reflecting Surface

Leaky wave antenna

FSS and Dielectric are equivalent for broadside radiation

Bandwidth Issues

Input Admittance:

$$Y_{in} = \frac{1}{(2\pi)^2} \iint_{-\infty}^{\infty} |M(k_x, k_y)|^2 G^{hm}(k_x, k_y) dk_x dk_y$$

Highly dominated by the presence of the leaky wave poles $\text{Res}(G^{hm}(k_x, k_y)) \propto \frac{1}{\sin\theta_{lw}}$

$$\text{BW} \longleftrightarrow \frac{Y^{ebg}(f_1)}{Y^{ebg}(f_2)} \approx \frac{k_{lw}(f_2)}{k_{lw}(f_1)}$$

$\epsilon_r \uparrow \quad \theta_{lw} \downarrow \quad \alpha_{lw} \downarrow \quad Dir \uparrow \quad BW \downarrow$

Leaky Wave Lens Feed

$\lambda d/4$ Quartz
Super/layer

$$Z_L = \frac{\zeta_0}{\epsilon_r} = \frac{\zeta_0}{3.8}$$

Waveguide Feed

$h = \lambda_0/2$ Cavity

Infinite
Silicon
Dielectric

10/2

$$Z_L = \frac{\zeta_0}{\sqrt{\epsilon_r}} = \frac{\zeta_0}{3.45}$$

**A leaky-wave/EBG cavity can
be used to illuminate a lens**

Same dispersion diagram than
quarter-wavelength superstrates

Leaky Wave Lens Feed

$$D = 4\pi A_{ef} / \lambda_0^2$$

Same effective area given by the same leaky wave mode

ϵ_r higher directivity for the same bandwidth or leaky wave frequency dispersion

$$D = 4\pi A_{ef} / \lambda_d^2 = 4\pi A_{ef} \epsilon_r / \lambda_0^2$$

Lens Radiated Fields in standard lenses

Waveguide Applications

Bragg Fibers

$$h_{d1} = \frac{\lambda_{d1}}{4 \cos \theta_{d1}}$$

$$h_{d2} = \frac{\lambda_{d2}}{4 \cos \theta_{d2}}$$

Same Resonant condition than
leaky wave antenna:

- They are used at near infrared and optical regimes.
- Field distribution similar than a circular waveguide

Loss in the
order of
dB/km

Field Shaping Application

Illumination of reflector
with 90% efficiency

Multi Beam Imaging for Telecom

Ka Band
Telecommunication
Applications
Earth Coverage by using
Multiple Antenna Beams

Technological Solutions

Use of reflectors for high directivity in combination with

- 1) Phased Arrays generating multiple beams
- 2) Focal Plane Arrays with Single Fed per Beam

Edge of Coverage Gain

The goal is to maximize the gain at the edge of coverage and keep the inter-beam interferences low

The best packaging is achieved for a hexagonal array

Far Field Beams

Standard Solution for ka Satellites

Use of 4 reflectors to increase the Geoc with $2\lambda_0 f_{\#}$ FPA

Diminish roll-off without increasing spill over

Beam generated by another reflector

$$G_{EoC} \approx D_m + SO + RO = D_m + 3.5dB$$

Overlapped Feeds

Is it possible to place them
closer in the FPA?

Use of Phased arrays:
Coherent beamforming of
3x3 or 5x5 sub arrays

Leaky wave/Fabry Perot Antennas

Antennas with directive patterns
and 'small physical areas'

Overlapped Feeds FPA

Loss due to the mutual coupling

Use of reactive loading to compensate for it: **Equivalent short circuits loads** for neighboring waveguides

1) Polarization discrimination

2) Frequency discrimination

Reactively Loaded case

10% Bandwidth

Important Points

Stratified GFs contain poles on bottom Riemann sheet

They correspond to leaky waves

These poles are complex and located closed to the real axes on the bottom Riemann sheet

These poles are not captured in deformations around branch, but in other deformations useful to obtain analytic evaluations of the near field

In the near field, the leaky waves are cylindrical waves, similar to surface waves but with an attenuation associated to radiation

Leaky waves can be used to shape the far field of small sources
